

Introduction to Engineering & Design Style Guide

This is the style guide for the Introduction to Engineering and Design (EG1004) course. All lab reports and the Final Design Reports (FDR) for Semester Long Design Projects in EG1004 must use the style that is described in this guide. This style guide applies solely to reports in EG1004. Other courses at the Tandon School of Engineering may use a different style guide so always ask professors if they have a preferred style for written material in their classes.

Lab reports may be written in Times New Roman, Calibri, Arial, or Atkinson Hyperlegible, but no other font. A report can only use one font. EG1004 does not require that equations written in Equation Editor be converted from Cambria Math, the default font in Equation Editor, to the font used throughout the rest of the report though converting that text is a best practice. The type size for all text, including the labels and captions on illustrations, must be 12 point. The text throughout all reports must be double spaced.

The section headers, Abstract, Introduction, Procedure, Data/Observations, Conclusions, Works Cited, Contribution Statement, and Original Data, must be used in every lab report. All section headers must be bolded in lab reports and FDRs.

All pages, except the Title page, must be numbered in a footer. The Title page is page 1. The page following the Title page is page 2. To remove the page number from the Title page, click on the footer that contains the page number and check Different First Page in the Options section in the Header & Footer toolbar.

All reports must use complete sentences. Reports may not use bullet points or numbered lists. All reports must use paragraphs. Paragraphs must be indicated with the first line indented with no space between paragraphs.

All lab reports and FDRs must be written in the passive voice. There may be rare instances where the use of a pronoun (e.g. she, he) is needed. In those instances, use the pronouns that are preferred by the individual being discussed. Where the preferred pronouns are not known, use they, them, their or use the individual's name.

The Abstract, Procedure, and Data/Observations sections must be written in the past tense. The Introduction and Conclusion sections will be a mix of tenses. Where there is a discussion of what occurred in the lab, the past tense must be used. No part of any lab report may be written as if the lab exercise has not occurred. Where there is a discussion of something that is always true, such as a definition, use the present tense.

Introduction to Engineering & Design Style Guide

The recommended word count for lab reports is 1,500 to 3,000 words though as the semester progresses, the reports become more complex and longer so the word count may increase. EG1004 does not have minimum or maximum word or page counts for lab reports or FDRs.

The best practice is to write lab reports in Microsoft Word on a PC. Using any other application, such as Google Docs, or using Word on an Apple computer will create formatting problems when the report is downloaded from eg.poly.edu. All team reports must be written in Google Docs and any formatting errors should be corrected in Word before those reports are submitted on eg.poly.edu. Microsoft Word is available for free to NYU students under Microsoft Office in Software Requirements in the Syllabus Content section in the student manual link on eg.poly.edu.

What follows in this style guide is a discussion of how the reports should be organized and the material that belongs in each section. In addition to this guide, the Assignment section for every lab exercise should be reviewed and the responses to the questions or comments in that section must be included in the correct section of the corresponding lab report. There are outlines for the reports for Labs 2, 3, and 5 in the Assignment sections for those labs. Those outlines must be used for those lab reports. The outlines or templates for the FDRs must be used for those reports.

Introduction to Engineering & Design Style Guide

Title page

The Title page of a report must have the name and number of the lab exercise as written in the student manual, the course name and section number, the author's name on a separate line from the lab partners, the full names of the lab partners, the lab date, and the report due date. The authors on team reports must be listed alphabetically from A to Z by last name on a single line. The text below shows an example of a Title page for an individual report.

Lab 12: Hot Air Balloon Competition

Introduction to Engineering and Design, Section Z5

Marie Curie

Lab partners: Ma Jun and Percy Julian

Lab date: 2/4/24

Due date: 2/11/24

Introduction to Engineering & Design Style Guide

Abstract

The Abstract is a summary of the report. It must have an objective, the major data from the lab exercise, and a conclusion.

For a competition lab, the major data and the conclusion are the competition equations and rankings of the competitors. In those lab exercises where a device was designed and built physically and/or virtually, the Abstract must note how the device was designed and built (e.g. in Tinkercad, Logic.ly, or on a breadboard), that it was tested, and that the test results were compared to the device's specifications demonstrating that the device did or did not perform to specifications.

If any part of the lab exercise was not completed, the Abstract must note that and report if any significant part of the lab exercise was completed outside of lab hours.

Abstracts may not contain citations to any source listed in Works Cited, references to any illustration in the report, or the introduction of acronyms.

The Abstract must be written in the past tense.

Introduction to Engineering & Design Style Guide

Introduction

The Introduction must contain the background information, formulas, ratios, equations, laws, principles, processes, specifications, and any other material the reader needs to know to understand the description of the exercise in the Procedure section, the data presented and discussed in Data/Observations, and the analysis of that data in the Conclusion section.

In a competition lab, the final paragraphs of the Introduction must be a discussion of the competition rules, a presentation of the competition equation without data input, and a discussion of how the competition equation, rules, and available materials influenced the design that was built. This design strategy discussion is required for all competition labs.

Pictures from the manual may be used in this section.

The Introduction will be a mix of tenses.

Introduction to Engineering & Design Style Guide

Procedure

The Procedure section must begin with a sentence that lists the materials used during the lab (e.g. The materials used were...).

The Procedure section is a description of the steps taken in the lab. This description must be sufficiently complete so that another person could follow the description and replicate the results. This section is presumed to be written in chronological order. Do not use language that indicates chronology (e.g. next, then, First, Second,).

Pictures of devices as they are being built or screenshots of programs as they are being coded should be used in this section to make the description of the lab exercise easier to understand. Tables that are partially completed can be used in this section to illustrate how a table was organized. Pictures of completed devices, completed tables, or screenshots of completed programs should be placed in Data/Observations.

Pictures of code or components of the exercise from the manual may be used in this section.

Where any part of the lab exercise was approved by the lab teaching assistants, that must be noted in the report (e.g. The design was reviewed and approved.).

The Procedure section must be written in the past tense.

Introduction to Engineering & Design Style Guide

Data/Observations

The Data/Observations section must contain all of the data that was produced during the lab exercise and a discussion of that data. Data includes tables showing any measurements made during the lab exercise, tables showing final results or competition results, pictures (e.g. top, front, side, isometric views) of completed devices, screenshots of completed programs or work performed virtually, and any calculations made during or after the lab exercise.

If a device was built virtually and/or physically in the lab, this section must explain how that device was tested. The test results can be presented in Data/Observations or in the Conclusion section. The test results must be compared to the specifications for the device to prove that the device did or did not operate correctly.

The Data/Observations section must be written in the past tense.

Introduction to Engineering & Design Style Guide

Conclusion

The Conclusion section must contain the analysis of the data that was presented in Data/Observations.

In a competition lab, this analysis must compare the performance of the competitors, as measured by the competition equation, to argue that one or more components of the competition equation controlled the competition results. For example, in a competition among hot air balloons that was judged by a competition equation using time afloat, cost, and number of paperclips carried (payload), an analysis might conclude that the first-place balloon's lowest cost won first place because the times afloat and payloads of all competitors were roughly the same.

For competitors that won second place or below, the Conclusion section in a competition lab must have a discussion of how a device would be altered to improve its standing in the competition. For example, in the same hot air balloon competition, an analysis might conclude that the second-place balloon might win first place if its volume was increased allowing it to carry a higher payload. In this discussion, the competition equation would have to be re-calculated to show how much the payload would have to be increased and the extent to which any increase in cost resulting from additional materials purchased to achieve the higher volume would have to be overcome with a higher payload. First-place competitors should also discuss improvements.

In a lab in which a device was designed and built physically and/or virtually, the test results must be presented in the Conclusion section if they were not presented in Data/Observations. The test results must be compared to the specifications for the device to prove that the device did or did not work according to its specifications.

This section can include comments on the lab exercise itself and the methods used.

The Conclusion will be a mix of tenses.

Introduction to Engineering & Design Style Guide

Contribution Statement

This section should describe the specific contributions the author or authors of the report made during the lab exercise. This section should be written in the active voice.

Introduction to Engineering & Design Style Guide

Works Cited

The Works Cited section is the bibliography or reference section of the report. The student manual must be listed here. Using sources other than the manual is encouraged. All sources that were relied on in the report must be listed in Works Cited and there must be in text citations to all sources listed in Works Cited. The source of any illustration that is used in the report that was not created by the report's author(s) must be listed in Works Cited and there must be a citation to that source in the caption accompanying that illustration. Illustrations that do not have a citation in the caption accompanying the illustration are assumed to have been created by the report's author(s).

EG1004 uses author/date format for in text citations to a source. Citations to the manual, including in captions for illustrations taken from the manual, should use (NYU Tandon, 2024) or (NYU, 2024). Where the author is a person, use the last name and the publication year (Smith, 2024). For sources with two authors, use the last names of both authors (Smith and Jones, 2024). For sources that have three or more authors, use et al. (Smith et al., 2024).

Introduction to Engineering & Design Style Guide

Original Data

Lab notes are placed here. Lab notes may not be used in any other section of a lab report.

Introduction to Engineering & Design Style Guide

Illustrations

In EG1004 reports, illustrations are typically tables, figures, and equations. Figures include pictures, graphs, charts, and screenshots. All illustrations must be numbered and tables and figures must have a caption (e.g. Figure 1: Hot Air Balloon Design, Table 1: Competition results.). Equations are numbered, but do not have a caption (e.g. (1), (2)). Tables, figures, and equations are numbered consecutively and separately.

Captions must be brief and sufficiently descriptive so that the data in the illustration can be understood without reading the text though the caption may not contain information or data that is not part of the discussion of the illustration. Captions may use title case, which capitalizes the first word in the caption and all important words, or sentence case, which capitalizes the first word in the caption and proper nouns. Captions may have a period at the end or not. One format must be used consistently throughout a report.

There must be text above every illustration that discusses the information in that illustration and contains the in text reference to that illustration. There must be an in text reference to every illustration in a lab report (e.g. (Table 1), as shown in Figure 1..., (1), Equation 1 shows...). Where an equation is referenced in the text use the number (e.g. (1)), but when a sentence begins with a reference to an equation use Equation and its number (e.g. Equation 1 shows...).

Illustrations must be referenced individually. A report cannot refer to two or more illustrations in one reference (e.g. The balloon design is shown in Figures 1 through 5). Multiple views of a single design can be presented as a single illustration (e.g. Figure 1: (l-r) Initial simulation and first redesign, Figure 1: (clockwise) Top, Side, Front, and Most Detailed Views of the Insulator).

All illustrations must be centered on the page and they must be directly below the paragraph containing the in text reference to that illustration. Do not wrap text around any illustration. The labels and captions for tables and figures should be placed flush with the left edge of the table or figure they identify and describe. The number that identifies an equation should be in parentheses (e.g. (1), (2)) and should be flush right on the same line as the equation.

Hand drawn sketches may not be used in any report in EG1004. Sketches must be rendered in Adobe Illustrator, Sketch Up Free, Canva, or a similar app.

Introduction to Engineering & Design Style Guide

Tables

The lab teaching assistants in EG1004 will collect the data and lab notes produced during each lab exercise and place data in tables or as scans in the Lab Documents section on eg.poly.edu. Check all tabs in any document in Lab Documents for data and lab notes. All tables in a lab report must be created in Excel.

The labels and captions for tables belong above tables.

In competition labs, the results for the device that is the primary subject of the report must be highlighted in any table showing the competition results. Competitors must be ranked by their standing in the competition in any table showing the competition results. Table 1 is an example of a table in a report on the second-place hot air balloon.

Table 1: Hot Air Balloon Competition Results

Trial #	Cost (\$)	Time Afloat (s)	Payload	CE	Rank
1	0.28	1.00	2.00	7.14	
2	0.28	1.23	2.00	8.79	1
1	0.48	0.00	12.00	0.00	
2	0.48	1.00	3.00	6.25	2
1	0.96	1.55	3.00	4.84	3
1	0.18	0.00	4.00	0.00	4
2	0.18	0.00	2.00	0.00	
3	0.18	0.00	4.00	0.00	
1	0.31	0.00	8.00	0.00	4

Introduction to Engineering & Design Style Guide

Figures

The labels and captions for figures belong below figures (Figure 1).

Figure 1: NASA Super-Pressure Balloon (NASA, 2017)

Introduction to Engineering & Design Style Guide

Equations

Equations must be written in Equation Editor. The number that identifies the equation must be placed in parentheses flush right on the page on the same line as the equation and the equation and its number must be on a separate line. The text below shows how an equation must be presented in a lab report.

The Ideal Gas Law predicts that when a body of gas is heated, it will expand.

With that expansion, its mass will remain the same, but its volume will increase

and its density will decrease. Another body of gas with the same mass, but a

lower temperature can have a much higher density. In the law (1), P is the gas

pressure, V is the volume of gas, T is its absolute temperature, and n is the

number of moles of gas. The universal gas constant R has a value of

0.0821 L · atm/mol · K (NYU Tandon, 2024).

$$PV = nRT \quad (1)$$

Introduction to Engineering & Design Style Guide

Numbers and Symbols

The general rule in EG1004 is that numbers above 10 must use the number and numbers below 10 must be spelled out. Use numbers for titles, ratios, competition equations, numbers using a decimal point, 1 and 0 as the values used in digital logic, and fractions (e.g. Lab 1, Table 1, Figure 1, 0.50). A number at the start of a sentence must always be spelled out.

Always use the number whenever a report discusses something that was measured (e.g. 5.00 cm, 8.00 in, 10.00 ml, 75.00 °F). The number must have units rendered with the standard abbreviation for the units. There must be a space between the number and the units except when reporting degrees of a plane angle (e.g. A 90.00° turn to the right, It was 10.00° off the center line). For measurements that do not have a standard abbreviation (e.g. cotton balls, sheets of tissue paper), the number should be spelled out for amounts below 10 and use the number for amounts at 10 or above. Ratios and competition equations do not have units.

Units are spelled out when they are not accompanied by a number (e.g. Current was measured in milliamps, Temperature was measured in degrees Fahrenheit).

Always place a zero before a decimal point and any numbers using a decimal point must be rounded to two places after the decimal point.

Introduction to Engineering & Design Style Guide

Software

There are many style guides for software documentation. In EG1004 reports, components of any software must be presented in the text as they appear in the software. In Fusion 360, for example, tools should be rendered as Extrude, Sweep, and Loft and workspaces should be rendered as the Design workspace or the Simulation workspace. Do not use bolding or quotes for software components.
